---

**Abstract.** In this paper, we introduce one interesting mathematical tool namely,  $(s, v)^*$ -dense, and analyze its nature in a bigeneralized topological space. Further, we prove some properties of this set and give the relationship between  $(s, v)$ -dense and  $(s, v)^*$ -dense sets. Finally, we give applications for various sets defined in a bigeneralized topological space.

**2020 Mathematics Subject Classifications:** AMS Subject Classification(2020):Primary: 54A05, 54A10.

**Key Words and Phrases:** Bigeneralized topological space,  $\mu_{(s,v)}$ -open,  $(s, v)$ -open,  $(s, v)$ -nowhere dense.

---

### 1. Introduction

The concept of a generalized topological space was introduced by Császár in [3]. Some researchers have defined various concepts in this space and examined their significance in a generalized topological space. Especially, in a generalized topological space, dense sets were introduced by Ekici [8]. He has proven few results for dense sets in a generalized topological space. Based on this, some mathematicians have proved various properties for dense sets e.g. [11, 12, 15, 17, 19].

In [10], J.C. Kelly introduced the concept namely, a bitopological space. Using these aspects, Boonpok founded the notion of a bigeneralized topological space in 2010 [2]. He examines the significance of  $(m, n)$ -closed sets in a bigeneralized topological space.

Inspired by all this, we define a new dense set, namely,  $(s, v)^*$ -dense set using semi-open sets in a bigeneralized topological space. Find various interesting results for  $(s, v)^*$ -dense sets.

Next section, the preliminary definitions, and lemmas are remembered.

In sections 3 & 4, in a bigeneralized topological space, examined the significance of  $(s, v)^*$ -dense set. The relationship between  $\mu$ -dense and  $(s, v)^*$ -dense sets are proven. Further, few results for  $(s, v)^*$ -dense sets using functions are launched. In the last section, we defined a soft set using  $(s, v)^*$ -dense sets and various types of open sets defined in a bigeneralized topological space.

## 2. Preliminaries

In [3], let  $X$  be any non-null set. A family  $\mu$  of subsets of  $X$  is a *generalized topology* in  $X$  if it contains the empty set and is closed under arbitrary union. The pair  $(X, \mu)$  is called a *generalized topological space* (GTS). If  $X \in \mu$ , then  $(X, \mu)$  is called a *strong generalized topological space* (sGTS).

In [6], if  $Q \in \mu$ , then  $Q$  is called a  $\mu$ -open set and if  $X - Q \in \mu$ , then  $Q$  is said to be a  $\mu$ -closed set. The *interior of*  $Q \subset X$  denoted by  $i_\mu(D)$ , is the union of all  $\mu$ -open sets contained in  $D$  and the *closure of*  $D$  denoted by  $c_\mu(D)$ , is the intersection of all  $\mu$ -closed sets containing  $D$  [12]. Here, the interior and closure of the set  $Q$  are notated by  $iQ$  and  $cQ$ , respectively, when no confusion can arise.

In [11], notated by;

$$\tilde{\mu} = \{D \in \mu \mid D \neq \emptyset\};$$

$$\mu(x) = \{D \in \mu \mid x \in D\}.$$

**Definition 1.** [8] A subset  $Q$  of a GTS  $(X, \mu)$  is said to be;

- $\mu$ -nowhere dense if  $icQ = \emptyset$ .
- $\mu$ -dense if  $cQ = X$ .
- $\mu$ -codense [7] if  $c(X - Q) = X$ .

**Definition 2.** [11] A subset  $Q$  of  $X$  is called as;

- $\mu$ -meager if  $Q = \bigcup_{m \in \mathbb{N}} Q_m$  where each  $Q_m$  is a  $\mu$ -nowhere dense set.
- $\mu$ -second category if  $Q$  is not  $\mu$ -meager.

In [11], defined two new generalized topologies;

$$\mu^* = \{\bigcup_t (L_1^t \cap L_2^t \cap L_3^t \cap \dots \cap L_{n_t}^t) \mid L_1^t, L_2^t, \dots, L_{n_t}^t \in \mu\};$$

$$\mu^{**} = \{D \subset X \mid D \text{ is of } \mu\text{-II category}\}.$$

Obviously,  $\mu \subset \mu^*$  and  $\mu^*$  is closed under finite intersection [11].

**Definition 3.** [6] Let  $(X, \mu)$  be a GTS and  $Q \subset X$  is called;

- $\mu$ -semi-open if  $Q \subset c_\mu(i_\mu(Q))$ .
- $\mu$ -pre-open if  $Q \subset i_\mu(c_\mu(Q))$ .
- $\mu$ - $\alpha$ -open if  $Q \subset i_\mu(c_\mu(i_\mu(Q)))$ .
- $\mu$ - $\beta$ -open if  $Q \subset c_\mu(i_\mu(c_\mu(Q)))$ .
- $\mu$ -b-open [1] if  $Q \subset c_\mu(i_\mu(Q)) \cup i_\mu(c_\mu(Q))$ .

Moreover,  $\sigma(\mu)$  or  $\sigma(\mu(X)) = \{Q \subset X \mid Q \text{ is } \mu\text{-semi-open set in } X\}$  [12]. The  $\mu$ -semi-interior of a subset  $Q$  of  $(X, \mu)$ , denoted by  $i_\sigma(Q)$ , is defined by the union of all  $\mu$ -semi-open subsets of  $X$  contained in  $Q$  [12].

**Definition 4.** [2] Let  $\mu_1$  and  $\mu_2$  be two generalized topologies defined a non-null set  $X$ . A triple  $(X, \mu_1, \mu_2)$  is called a *bigeneralized topological space* (briefly, BGTS).

- The *closure* and *interior* of  $Q \subset X$  with respect to  $\mu_s$  are denoted by  $c_s(Q)$  and  $i_s(Q)$ , respectively, for  $s = 1, 2$ .
- $Q$  is called  $(s, v)$ -closed if  $c_s(c_v(Q)) = D$ , where  $s, v = 1$  or  $2$ ;  $s \neq v$ .
- $Q$  is called  $(s, v)$ -open if  $X - Q$  is  $(s, v)$ -closed where  $s, v = 1$  or  $2$ ;  $s \neq v$ .

A subset  $Q$  of a BGTS  $(X, \mu_1, \mu_2)$  is said to be

- (1)  $(s, v)$ - $\mu$ -regular open if  $Q = i_s(c_v(Q))$  where  $s, v = 1$  or  $2$ ;  $s \neq v$ .
- (2)  $(s, v)$ - $\mu$ -semi-open if  $Q \subseteq c_v(i_s(Q))$  where  $s, v = 1$  or  $2$ ;  $s \neq v$ .
- (3)  $(s, v)$ - $\mu$ -preopen if  $Q \subseteq i_s(c_v(Q))$  where  $s, v = 1$  or  $2$ ;  $s \neq v$ .
- (4)  $(s, v)$ - $\mu$ - $\alpha$ -open if  $Q \subseteq i_s(c_v(i_s(Q)))$  where  $s, v = 1$  or  $2$ ;  $s \neq v$  [2].

**Lemma 1.** [2, Proposition 3.4] Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $Q \subset X$ . Then  $Q$  is  $(s, v)$ -closed if and only if  $Q$  is both  $\mu$ -closed in  $(X, \mu_s)$  and  $(X, \mu_v)$  where  $s, v = 1, 2$ ;  $s \neq v$ .

**Lemma 2.** [5] In a GTS  $(X, \mu)$ ,  $r \in cP$  if and only if  $L \cap P \neq \emptyset$  for all  $L \in \tilde{\mu}(r)$ .

**Lemma 3.** [12, Lemma 3.2] Let  $(X, \mu)$  be a GTS and  $K, P \subset X$ . If  $K \in \tilde{\mu}$  and  $K \cap P = \emptyset$ , then  $K \cap cP = \emptyset$ .

**Lemma 4.** [13, Proposition 2.2] Let  $(X, \mu)$  be a GTS. For subsets  $Q, P \subset X$ , then the following properties holds:

- (a)  $c_\mu(X - Q) = X - i_\mu(Q)$  and  $i_\mu(X - Q) = X - c_\mu(Q)$ .
- (b) If  $X - Q \in \mu$ , then  $c_\mu(Q) = Q$  and if  $Q \in \mu$ , then  $i_\mu(Q) = Q$ .
- (c) If  $Q \subseteq P$ , then  $c_\mu(Q) \subseteq c_\mu(P)$  and  $i_\mu(Q) \subseteq i_\mu(P)$ .
- (d)  $Q \subseteq c_\mu(Q)$  and  $i_\mu(Q) \subseteq Q$ .
- (e)  $c_\mu(c_\mu(Q)) = c_\mu(Q)$  and  $i_\mu(i_\mu(Q)) = i_\mu(Q)$ .

### 3. Nature of $(s, v)^*$ -dense sets

Here, we define another branch of dense set namely,  $(s, v)^*$ -dense set and study its significance in a BGTS.

In a bigeneralized topological space, various interesting results for  $(s, v)^*$ -dense sets are derived which is helpful for examining the given set is  $(s, v)^*$ -dense or not.

**Definition 5.** A GTS  $(X, \mu)$  is called as;

- *hyperconnected* [8] if  $c_\mu(Q) = X$  whenever  $Q \in \tilde{\mu}$ .
- *generalized submaximal* [7] if  $Q \in \tilde{\mu}$  whenever  $c_\mu(Q) = X$ .

**Definition 6.** [16] A GT  $\mu$  on  $X$  is said to satisfy the  $\mathcal{I}$ -property whenever  $W_1, W_2, \dots, W_m \in \mu$  with  $W_1 \cap W_2 \cap \dots \cap W_m \neq \emptyset, i_\mu(W_1 \cap W_2 \cap \dots \cap W_m) \neq \emptyset$ .

**Definition 7.** [9] A non-null subset  $Q$  of a BGTS  $(X, \mu_1, \mu_2)$  is called  $(s, v)$ -dense if  $c_s(c_v(Q)) = X$  where  $s, v = 1, 2$  and  $s \neq v$ .

Moreover,  $(s, v) - \mathcal{D}(X) = \{Q \subset X \mid Q \text{ is a } (s, v)\text{-dense set in } X\}$  where  $s, v = 1, 2 ; s \neq v$ .

**Definition 8.** Let  $Q$  be a non-null subset of a bigeneralized topological space  $(X, \mu_1, \mu_2)$ . Then  $Q$  is called  $(\mu_s, \mu_v)^*$ -dense (briefly,  $(s, v)^*$ -dense) if  $c_v(Q) \cap M \neq \emptyset$  for every  $M \in \tilde{\sigma}_s$  where  $s, v = 1, 2 ; s \neq v; \sigma_s = \sigma(\mu_s)$ .

For simplification we noted;

$$(s, v)^* - \mathcal{D}(X) = \{Q \subset X \mid Q \text{ is a } (s, v)^*\text{-dense set in } X\}$$

where  $s, v = 1, 2 ; s \neq v$ .

**Remark 9.** In a BGTS, if  $P \in (s, v)^* - \mathcal{D}(X)$  and  $P \subset Q$ , then  $Q \in (s, v)^* - \mathcal{D}(X)$ .

**Example 10.** Consider the bigeneralized topological space  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{p, q\}, \{q, r\}, \{p, q, r\}\}$$

and

$$\mu_2 = \{\emptyset, \{p, s\}, \{q, s\}, \{p, q, s\}\}.$$

Then

$$\sigma_1 = \{\emptyset, \{p, q\}, \{q, r\}, \{p, q, r\}, \{p, q, s\}, \{q, r, s\}, X\}.$$

Take  $K = \{q, r\}$ . Then  $c_2(K) = K$ . Also,  $K \cap M \neq \emptyset$  for all  $M \in \tilde{\sigma}_1$ . Thus,  $c_2(K) \cap M \neq \emptyset$  for all  $M \in \tilde{\sigma}_1$ . Therefore,  $K \in (1, 2)^* - \mathcal{D}(X)$ .

(b) Consider the bigeneralized topological space  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{q, r\}, \{q, s\}, \{q, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{p, q\}, \{p, r\}, \{p, q, r\}\}.$$

Then

$$\sigma_2 = \{\emptyset, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, q, s\}, \{p, r, s\}, X\}.$$

Take  $J = \{p, r\}$ . Here  $c_1(J) \cap H \neq \emptyset$  for all  $H \in \tilde{\sigma}_2$ . Hence  $J \in (2, 1)^* - \mathcal{D}(X)$ .

**Theorem 11.** *Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $c_{\mu_s}(Q) = X$ . If  $\mu_s$  is a sGT, then  $Q \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2 ; s \neq v$ .*

*Proof.* Take  $s = 1$  and  $v = 2$ . Assume that,  $c_{\mu_1}(Q) = X$  and  $\mu_1$  is a sGT. Let  $P \in \tilde{\sigma}_1$ . Then  $P \subset c_{\mu_1}(i_{\mu_1}(P))$  and so  $i_{\mu_1}(P) \neq \emptyset$ , since  $\mu_1$  is a sGT. This implies  $i_{\mu_1}(P) \in \tilde{\mu}_1$  which implies that  $i_{\mu_1}(P) \cap Q \neq \emptyset$ . Thus,  $Q \cap P \neq \emptyset$ . Therefore,  $Q \in (1, 2)^* - \mathcal{D}(X)$ .

Take  $s = 2$  and  $v = 1$ . Suppose  $c_{\mu_2}(Q) = X$  and  $\mu_2$  is a sGT. Let  $M \in \tilde{\sigma}_2$ . Then  $M \subset c_{\mu_2}(i_{\mu_2}(M))$  and so  $i_{\mu_2}(M) \neq \emptyset$ , since  $\mu_2$  is a sGT. Thus,  $i_{\mu_2}(M) \in \tilde{\mu}_2$  so that  $i_{\mu_2}(M) \cap Q \neq \emptyset$ . This implies  $Q \cap M \neq \emptyset$  which implies that  $Q \in (2, 1)^* - \mathcal{D}(X)$ .

The below Example 12 shows that the hypothesis in Theorem 11 can not be dropped.

**Example 12.** (a). Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{q, s\}, \{r, s\}, \{q, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{p, r\}, \{q, r\}, \{p, q, r\}, \{p, q, s\}, X\}.$$

Fix  $s = 1; v = 2$ . Obviously,

$$\sigma_1 = \{\emptyset, \{p\}, \{q, s\}, \{r, s\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}.$$

Choose  $L = \{q, s\}$  so that  $c_{\mu_1}L = X$  and  $c_{\mu_2}L = L$ . Thus,  $L = \{q, s\}$  is  $\mu_1$ -dense. But  $c_{\mu_2}L \cap \{p\} = \emptyset$  where  $\{p\} \in \tilde{\sigma}_1$  for that  $L \notin (1, 2)^* - \mathcal{D}(X)$ .

(b). Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{p, r\}, \{q, r\}, \{r, s\}, \{p, q, r\}, \{p, r, s\}, \{q, r, s\}, X\}$$

and

$$\mu_2 = \{\emptyset, \{p, s\}, \{q, s\}, \{p, q, s\}\}.$$

Fix  $s = 2; v = 1$ . Obviously,

$$\sigma_2 = \{\emptyset, \{r\}, \{p, s\}, \{q, s\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}.$$

Choose  $K = \{s\}$  so that  $c_{\mu_1}K = K$  and  $c_{\mu_2}K = X$ . Here,  $K = \{s\}$  is  $\mu_2$ -dense. But  $c_{\mu_1}K \cap \{r\} = \emptyset$  where  $\{r\} \in \tilde{\sigma}_2$  for that  $K \notin (2, 1)^* - \mathcal{D}(X)$ .

**Theorem 13.** Let  $(X, \mu_1, \mu_2)$  be a BGTS. Then the following are true.

- (a) If  $c_{\mu_v}(Q) = X$ , then  $Q \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2 ; s \neq v$ .
- (b) If  $\mu_s \subset \mu_v$ , then every  $(s, v)^*$ -dense is  $\mu_s$ -dense where  $s, v = 1, 2 ; s \neq v$ .

*Proof.* (a). Assume that,  $c_{\mu_v}(Q) = X$  for  $v = 1, 2$ .

Fix  $s = 1$  and  $v = 2$ . We get  $c_{\mu_2}(Q) = X$  so that  $c_{\mu_2}(Q) \cap H \neq \emptyset$  for all  $H \in \tilde{\sigma}_1$ . Therefore,  $Q$  is  $(1, 2)^* - \mathcal{D}(X)$ .

Take  $s = 2$  and  $v = 1$ . Then  $c_{\mu_1}(Q) = X$  and so  $c_{\mu_1}(Q) \cap K \neq \emptyset$  for all  $K \in \tilde{\sigma}_2$ . Therefore,  $Q$  is  $(2, 1)^* - \mathcal{D}(X)$ .

(b). Suppose that  $\mu_s \subset \mu_v$  for  $s, v = 1, 2 ; s \neq v$ . Let  $K \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2 ; s \neq v$ .

Consider  $s = 1$  and  $v = 2$ . Then  $\mu_1 \subset \mu_2$  and  $K \in (1, 2)^* - \mathcal{D}(X)$ . Let  $G \in \tilde{\mu}_1$ . Then  $G \in \tilde{\sigma}_1$  so that  $G \cap c_{\mu_2}K \neq \emptyset$ . By hypothesis and Lemma 3,  $G \cap K \neq \emptyset$ . Hence  $K$  is  $\mu_1$ -dense.

Take  $s = 2$  and  $v = 1$ . Then  $\mu_2 \subset \mu_1$  and  $K \in (2, 1)^* - \mathcal{D}(X)$ . Let  $H \in \tilde{\mu}_2$ . Then  $H \in \tilde{\sigma}_2$  so that  $H \cap c_{\mu_1}K \neq \emptyset$ . By hypothesis and Lemma 3,  $H \cap K \neq \emptyset$ . Hence  $K$  is  $\mu_2$ -dense.

The below Example 14 (b) shows that the converse part of Theorem 13 (a) need not be true and the hypothesis of Theorem 13 (b) can not be neglected as shown by Example 14 (a).

**Example 14.** Consider the bigeneralized topological space  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{p, r\}, \{p, s\}, \{p, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{q, r\}, \{q, s\}, \{r, s\}, \{q, r, s\}\}.$$

We get

$$\sigma_1 = \{\emptyset, \{q\}, \{p, r\}, \{p, s\}, \{p, q, r\}, \{p, q, s\}, \{p, r, s\}, X\}$$

and

$$\sigma_2 = \{\emptyset, \{p\}, \{q, r\}, \{q, s\}, \{r, s\}, \{p, q, r\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}.$$

(a). Fix  $s = 1; v = 2$ . Here,  $\mu_1 \not\subset \mu_2$ . Choose  $Q = \{q, r\}$  we get  $Q \in (1, 2)^* - \mathcal{D}(X)$ . Because,  $c_2Q \cap L \neq \emptyset$  for all  $L \in \tilde{\sigma}_1$ . But  $c_1Q = Q \neq X$  so that  $Q$  is not  $\mu_1$ -dense.

Take  $s = 2, v = 1$  and  $L = \{p, q\}$ . Here,  $c_1L \cap D \neq \emptyset$  for each  $D \in \tilde{\sigma}_2$  so that  $L \in (2, 1)^* - \mathcal{D}(X)$ . Since  $c_2L = L \neq \emptyset$  we have  $L$  is not  $\mu_2$ -dense.

(b). Fix  $s = 1; v = 2$ . Choose  $W = \{p, q\}$  we get  $W \in (1, 2)^* - \mathcal{D}(X)$ , since  $c_2W \cap L \neq \emptyset$  for all  $L \in \tilde{\sigma}_1$ . Here,  $c_2W = W \neq X$  so that  $W$  is not a  $\mu_2$ -dense set.

Take  $s = 2; v = 1$ . Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{p, r\}, \{p, s\}, \{r, s\}, \{p, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{q, r\}, \{q, s\}, \{q, r, s\}\}.$$

Clearly, we have

$$\sigma_1 = \{\emptyset, \{q\}, \{p, r\}, \{p, s\}, \{r, s\}, \{p, q, r\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}$$

and

$$\sigma_2 = \{\emptyset, \{p\}, \{q, r\}, \{q, s\}, \{p, q, r\}, \{p, q, s\}, \{q, r, s\}, X\}.$$

Consider  $K = \{p, q\}$ . Since  $c_1K \cap M \neq \emptyset$  for all  $M \in \tilde{\sigma}_2$  we get  $K \in (2, 1)^* - \mathcal{D}(X)$ . But  $c_1K = K \neq X$ . Thus,  $K$  is not  $\mu_1$ -dense.

**Theorem 15.** *Let  $(X, \mu_1, \mu_2)$  be a BGTS. Then  $(s, v)^* - \mathcal{D}(X) \subset (s, v) - \mathcal{D}(X)$  where  $s, v = 1, 2$ ;  $s \neq v$ .*

*Proof.* Let  $Q \in (s, v)^* - \mathcal{D}(X)$ .

Take  $s = 1; v = 2$ . Then  $Q \in (1, 2)^* - \mathcal{D}(X)$  so that  $c_2(Q) \cap M \neq \emptyset$  for every  $M \in \tilde{\sigma}_1$ . Since  $\mu_1 \subset \sigma_1$ ,  $c_2(Q) \cap K \neq \emptyset$  for every  $K \in \tilde{\mu}_1$ . Therefore,  $Q \in (1, 2) - \mathcal{D}(X)$ .

Fix  $s = 2; v = 1$ . We get  $Q \in (2, 1)^* - \mathcal{D}(X)$  for that  $c_1(Q) \cap L \neq \emptyset$  for every  $L \in \tilde{\sigma}_2$ . Since  $\mu_2 \subset \sigma_2$ ,  $c_1(Q) \cap G \neq \emptyset$  for every  $G \in \tilde{\mu}_2$ . Therefore,  $Q \in (2, 1) - \mathcal{D}(X)$ .

The below Example 16 shows that in a bigeneralized topological space, the reverse implication of the above Theorem 15 need not be true in general.

**Example 16.** *Consider the bigeneralized topological space  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;*

$$\mu_1 = \{\emptyset, \{p, r\}, \{r, s\}, \{p, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{p, q\}, \{p, r\}, \{q, r\}, \{p, q, r\}\}.$$

Then

$$\sigma_1 = \{\emptyset, \{q\}, \{p, r\}, \{r, s\}, \{p, q, r\}, \{p, r, s\}, \{q, r, s\}, X\}$$

and

$$\sigma_2 = \{\emptyset, \{s\}, \{p, q\}, \{p, r\}, \{q, r\}, \{p, q, r\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}.$$

• Fix  $s = 1$  and  $v = 2$ . Choose  $K = \{p, s\}$  we get  $K$  is  $(1, 2)$ -dense. But  $K \notin (1, 2)^* - \mathcal{D}(X)$ . For, if we choose  $D = \{q\}$ , then  $D \in \tilde{\sigma}_1$ . But  $D \cap c_2(K) = \emptyset$ . Thus, there is  $D \in \tilde{\sigma}_1$  such that  $D \cap c_2(K) = \emptyset$ .

• Fix  $s = 2$  and  $v = 1$ . Take  $L = \{p, q\}$ , then we get  $L \in (1, 2) - \mathcal{D}(X)$ . Here, we take  $H = \{s\}$  so that  $H \in \tilde{\sigma}_2$  but  $H \cap c_1(L) = \emptyset$ . Thus,  $L \notin (1, 2)^* - \mathcal{D}(X)$ .

**Theorem 17.** Let  $(X, \mu_1, \mu_2)$  be a BGTS. If  $\mu_s$  is a sGT, then  $(s, v) - \mathcal{D}(X) \subset (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Assume that,  $\mu_s$  is sGT and  $Q \in (s, v) - \mathcal{D}(X)$ .

Take  $s = 1; v = 2$ . Then  $Q \in (1, 2) - \mathcal{D}(X)$  so that  $c_1(c_2(Q)) = X$ . Thus,  $c_2(Q) \cap M \neq \emptyset$  for all  $M \in \tilde{\mu}_1$ . Let  $H \in \tilde{\sigma}_1$ . Suppose  $H \in \tilde{\mu}_1$ . Then there is nothing to prove. Suppose  $H \notin \tilde{\mu}_1$ . Here  $H \subset c_1(i_1(H))$ . This implies  $c_1(i_1(H)) \neq \emptyset$  which implies that  $i_1(H) \neq \emptyset$ , by hypothesis. Thus,  $i_1(H) \in \tilde{\mu}_1$  so that  $c_2(Q) \cap H \neq \emptyset$ . Thus,  $c_2(Q) \cap H \neq \emptyset$  for all  $H \in \tilde{\sigma}_1$ . Hence  $Q \in (1, 2)^* - \mathcal{D}(X)$ .

Fix  $s = 2; v = 1$ . We get  $Q \in (2, 1) - \mathcal{D}(X)$  such that  $c_2(c_1(Q)) = X$  which implies  $c_1(Q) \cap L \neq \emptyset$  for all  $L \in \tilde{\mu}_2$ . Let  $K \in \tilde{\sigma}_2$ . Suppose  $K \in \tilde{\mu}_2$ . Then there is nothing to prove. If  $K \notin \tilde{\mu}_2$ , then from the definition of  $K$  such that  $K \subset c_2(i_2(K))$ . This implies  $c_2(i_2(K)) \neq \emptyset$  which implies that  $i_2(K) \neq \emptyset$  since  $\mu_2$  is a sGT. Thus,  $i_2(K) \in \tilde{\mu}_2$  so that  $c_1(Q) \cap K \neq \emptyset$ . Thus,  $c_1(Q) \cap K \neq \emptyset$  for all  $K \in \tilde{\sigma}_2$ . Hence  $Q \in (2, 1)^* - \mathcal{D}(X)$ .

The above Example 16 also proves that the hypothesis of Theorem 17 can not be dropped.

**Theorem 18.** Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $\mu_1 \subset \mu_2$ . If  $\mu_1 \subset (s, v)^* - \mathcal{D}(X)$ , then  $(X, \mu_1)$  is hyperconnected for  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Let  $Q \in \tilde{\mu}_1$ .

Choose  $s = 1$  and  $v = 2$ . Then  $Q \in (1, 2)^* - \mathcal{D}(X)$ . By hypothesis and Theorem 13,  $Q$  is  $\mu_1$ -dense so that  $(X, \mu_1)$  is a hyperconnected space.

Fix  $s = 2$ ;  $v = 1$ . Then  $Q \in (2, 1)^* - \mathcal{D}(X)$  so that  $c_1(Q) \cap M \neq \emptyset$  for every  $M \in \tilde{\sigma}_2$ . Let  $K \in \tilde{\mu}_1$ . By hypothesis,  $K \in \tilde{\mu}_2$  which implies  $K \in \tilde{\sigma}_2$ , since  $\mu_2 \subset \sigma_2$  which turn implies that  $c_1(Q) \cap K \neq \emptyset$ . Thus,  $Q \cap K \neq \emptyset$ . Since  $K$  is an arbitrary non-null  $\mu_1$ -open set,  $Q$  is  $\mu_1$ -dense. Therefore,  $(X, \mu_1)$  is a hyperconnected space.

**Theorem 19.** Let  $(X, \mu_1, \mu_2)$  be a BGTS. If  $\mu_2 \subset \mu_1$  and if  $\mu_2 \subset (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2$ ;  $s \neq v$ , then  $(X, \mu_2)$  is hyperconnected.

*Proof.* Let  $P \in \tilde{\mu}_2$ .

Take  $s = 1$  and  $v = 2$ . Then  $P \in (1, 2)^* - \mathcal{D}(X)$  so that  $c_2(P) \cap M \neq \emptyset$  for every  $M \in \tilde{\sigma}_1$ . Let  $K \in \tilde{\mu}_2$ . By hypothesis,  $K \in \tilde{\mu}_1$  which implies  $K \in \tilde{\sigma}_1$ , since  $\mu_1 \subset \sigma_1$  which turn implies that  $c_2(P) \cap K \neq \emptyset$ . Thus,  $P \cap K \neq \emptyset$ . Since  $K$  is an arbitrary non-null  $\mu_2$ -open set,  $P$  is  $\mu_2$ -dense. Hence  $(X, \mu_2)$  is hyperconnected.

Now we choose  $s = 2 ; v = 1$ . We get  $P \in (2, 1)^* - \mathcal{D}(X)$ . By Theorem 13 and hypothesis, we get  $Q$  is  $\mu_2$ -dense. Therefore,  $(X, \mu_2)$  is a hyperconnected space.

**Theorem 20.** Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $Q \in (s, v) - \mathcal{D}(X); Q \in \mu_v; J \in (v, s)^* - \mathcal{D}(X)$ . If  $\mu_v \subset \mu_s$  and if  $\mu_v$  has the  $\mathcal{I}$ -property, then  $Q \cap J \in (v, s) - \mathcal{D}(X)$  where  $s, v = 1, 2 ; s \neq v$ .

*Proof.* Fix  $s = 1, v = 2$ . Assume that,  $Q \in (1, 2) - \mathcal{D}(X); Q \in \mu_2$  and  $J \in (2, 1)^* - \mathcal{D}(X)$ . Then

$$(a) \quad c_1(c_2(Q)) = X.$$

$$(b) \quad c_1J \cap M \neq \emptyset \quad \text{for all } M \in \tilde{\sigma}_2.$$

Suppose  $\mu_2$  has the  $\mathcal{I}$ -property and  $\mu_2 \subset \mu_1$ . Let  $K \in \tilde{\mu}_2$ . By hypothesis,  $K \in \tilde{\mu}_1$  so that  $K \cap c_2(Q) \neq \emptyset$ , by (a) which implies that  $K \cap Q \neq \emptyset$ , by Lemma 3. By our assumption,  $i_2(K \cap Q) \neq \emptyset$ . By (b),  $c_1J \cap i_2(K \cap Q) \neq \emptyset$  which implies  $c_2J \cap i_2(K \cap Q) \neq \emptyset$  by hypothesis which turn implies that  $J \cap i_2(K \cap Q) \neq \emptyset$ , by Lemma 3. Thus,  $J \cap (K \cap Q) \neq \emptyset$  so that  $(J \cap Q) \cap K \neq \emptyset$ . Therefore,  $c_1(J \cap Q) \cap K \neq \emptyset$ . Hence  $Q \cap J \in (2, 1) - \mathcal{D}(X)$ .

Take  $s = 2, v = 1$ . Assume that,  $Q \in (2, 1) - \mathcal{D}(X); Q \in \mu_1$  and  $J \in (1, 2)^* - \mathcal{D}(X)$ . We get

$$(c) \quad c_2(c_1(Q)) = X.$$

$$(d) \quad c_2J \cap H \neq \emptyset \quad \text{for all } H \in \tilde{\sigma}_1.$$

Suppose  $\mu_1$  has the  $\mathcal{I}$ -property and  $\mu_1 \subset \mu_2$ . Let  $L \in \tilde{\mu}_1$ . By hypothesis,  $L \in \tilde{\mu}_2$  so that  $L \cap c_1(Q) \neq \emptyset$ , by (c) which implies that  $L \cap Q \neq \emptyset$ , by Lemma 3. By our assumption,  $i_1(L \cap Q) \neq \emptyset$ . By (d),  $c_2J \cap i_1(L \cap Q) \neq \emptyset$ . This implies  $c_1J \cap i_1(L \cap Q) \neq \emptyset$  by hypothesis which implies that  $J \cap i_1(L \cap Q) \neq \emptyset$ , by Lemma 3. Thus,  $J \cap (L \cap Q) \neq \emptyset$  so that  $(J \cap Q) \cap L \neq \emptyset$ . Therefore,  $c_2(J \cap Q) \cap L \neq \emptyset$ . Hence  $Q \cap J \in (1, 2) - \mathcal{D}(X)$ .

Moreover, in a BGTS every  $\mu_v$ -dense set is  $(s, v)$ -preopen where  $s, v = 1, 2 ; s \neq v$ .

**Theorem 21.** Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $\eta_1 = \{Q \subset X \mid Q \in (1, 2)^* - \mathcal{D}(X); \eta_2 = \{P \subset X \mid P \in (2, 1)^* - \mathcal{D}(X)\}$ . Then

- (a) If  $\zeta = \eta_1 \cup \{\emptyset\}$  and if  $\emptyset \neq \zeta \subset \mu_1 \cap \mu_2$ , then  $(X, \zeta)$  is a hyperconnected space.
- (b) If  $\zeta = \eta_2 \cup \{\emptyset\}$  and if  $\emptyset \neq \zeta \subset \mu_1 \cap \mu_2$ , then  $(X, \zeta)$  is a hyperconnected space.

*Proof.* (a) Assume that,  $\zeta = \eta_1 \cup \{\emptyset\}$  and  $\emptyset \neq \zeta \subset \mu_1 \cap \mu_2$ . Let  $K \in \tilde{\zeta}$ . Then  $K \in (1, 2)^* - \mathcal{D}(X)$  and so  $c_2K \cap J \neq \emptyset$  for all  $J \in \tilde{\sigma}_1$ . Let  $D \in \tilde{\zeta}$ . By hypothesis,  $D \in \mu_1$  so that  $D \in \tilde{\sigma}_1$ . Thus,  $c_2K \cap D \neq \emptyset$ . Since  $D \in \mu_2$  we have  $K \cap D \neq \emptyset$ , by Lemma 3. Hence  $K$  is  $\zeta$ -dense. Therefore,  $(X, \zeta)$  is a hyperconnected space.

(b) Suppose that,  $\zeta = \eta_2 \cup \{\emptyset\}$  and  $\emptyset \neq \zeta \subset \mu_1 \cap \mu_2$ . Let  $P \in \tilde{\zeta}$ . Then  $P \in (2, 1)^* - \mathcal{D}(X)$  and so  $c_1P \cap J \neq \emptyset$  for all  $J \in \tilde{\sigma}_2$ . Let  $M \in \tilde{\zeta}$ . By hypothesis,  $M \in \mu_2$  so that  $M \in \tilde{\sigma}_2$ . Thus,  $c_1P \cap M \neq \emptyset$ . Since  $M \in \mu_1$  we have  $P \cap M \neq \emptyset$ , by Lemma 3. Hence  $P$  is  $\zeta$ -dense. Therefore,  $(X, \zeta)$  is a hyperconnected space.

**Definition 22.** Let  $(X, \mu)$  be a GTS. A GT  $\mu$  is said to satisfy the  $\mathcal{I}_{\mathcal{D}}$ -property if  $P \in \tilde{\mu}$  and  $c_{\mu}Q = X$ , then  $i_{\mu}(P \cap Q) \neq \emptyset$ .

**Theorem 23.** Let  $(X, \mu_1, \mu_2)$  be a bigeneralized topological space and  $\eta_1 = \{P \subset X \mid c_{\mu_1}P = X\}$ ;  $\eta_2 = \{Q \subset X \mid c_{\mu_2}Q = X\}$ . Then

- (a) If  $\emptyset \neq \zeta = \eta_1 \cup \{\emptyset\}$  and if  $\mu_1$  has  $\mathcal{I}_{\mathcal{D}}$ -property, then  $(X, \zeta)$  is a hyperconnected space.  
 (b) If  $\emptyset \neq \zeta = \eta_2 \cup \{\emptyset\}$  and if  $\mu_2$  has  $\mathcal{I}_{\mathcal{D}}$ -property, then  $(X, \zeta)$  is a hyperconnected space.

*Proof.* (a) Suppose  $\emptyset \neq \zeta = \eta_1 \cup \{\emptyset\}$  and if  $\mu_1$  has  $\mathcal{I}_{\mathcal{D}}$ -property. Let  $K \in \tilde{\zeta}$ . Then  $c_{\mu_1}K = X$  and so  $K \cap J \neq \emptyset$  for every  $J \in \tilde{\mu}_1$ . Take  $H \in \tilde{\zeta}$  which implies that  $H \cap M \neq \emptyset$  for all  $M \in \tilde{\mu}_1$ . Thus, there is  $D \in \tilde{\mu}_1$  such that  $K \cap D \neq \emptyset$  and  $H \cap D \neq \emptyset$ . Since  $c_{\mu_1}H = X$  and  $D \in \tilde{\mu}_1$  we have  $i_{\mu_1}(H \cap D) \neq \emptyset$ , by hypothesis. Thus,  $i_{\mu_1}(H \cap D) \in \tilde{\mu}_1$  which implies that  $K \cap i_{\mu_1}(H \cap D) \neq \emptyset$  which turn implies that  $K \cap H \neq \emptyset$ . Therefore,  $K$  is  $\zeta$ -dense. Hence  $(X, \zeta)$  is a hyperconnected space.

(b) Assume that,  $\emptyset \neq \zeta = \eta_2 \cup \{\emptyset\}$  and if  $\mu_2$  has  $\mathcal{I}_{\mathcal{D}}$ -property. Let  $L \in \tilde{\zeta}$ . Then  $c_{\mu_2}L = X$  and so  $L \cap J \neq \emptyset$  for every  $J \in \tilde{\mu}_2$ . Take  $H \in \tilde{\zeta}$  which implies that  $H \cap K \neq \emptyset$  for all  $K \in \tilde{\mu}_2$ . Thus, there is  $D \in \tilde{\mu}_2$  such that  $L \cap D \neq \emptyset$  and  $H \cap D \neq \emptyset$ . Since  $c_{\mu_2}H = X$  and  $D \in \tilde{\mu}_2$  we have  $i_{\mu_2}(H \cap D) \neq \emptyset$ , by hypothesis. Thus,  $i_{\mu_2}(H \cap D) \in \tilde{\mu}_2$  which implies that  $L \cap i_{\mu_2}(H \cap D) \neq \emptyset$  which turn implies that  $L \cap H \neq \emptyset$ . Therefore,  $L$  is  $\zeta$ -dense. Hence  $(X, \zeta)$  is a hyperconnected space.

**Theorem 24.** Let  $(X, \mu_1, \mu_2)$  be a bigeneralized topological space where  $\mu_1 = \mu$  and  $\mu_2 = \mu^{**} \neq \emptyset$ ,  $\mu$  is a generalized topology on  $X$ . Then every  $\mu^{**}$ -dense set is  $(2, 1)^*$ -dense set in  $X$ .

*Proof.* Let  $K$  be a  $\mu^{**}$ -dense set. Then  $c_2(K) = X$ . By hypothesis,  $\mu_2$  is a sGT. By Theorem 11,  $K$  is a  $(2, 1)^*$ -dense set in  $X$ .

**Theorem 25.** Let  $(X, \mu_1, \mu_2)$  satisfy the condition; if  $P \in \tilde{\mu}_1$ ;  $Q \in \tilde{\mu}_2$  and  $P \cap Q \neq \emptyset$ , then  $i_{\mu_1}(P \cap Q) \neq \emptyset$  here  $\mu_1 = \mu$  and  $\mu_2 = \mu^{**} \neq \emptyset$  where  $\mu$  is a GT on  $X$ . Then every  $(1, 2)^*$ -dense set is  $\mu_2$ -dense set in  $X$ .

*Proof.* Let  $P \in (1, 2)^* - \mathcal{D}(X)$ . Then  $c_2P \cap K \neq \emptyset$  for all  $K \in \tilde{\sigma}_1$ . Let  $L \in \tilde{\mu}_2$ . Then  $L$  is of  $\mu$ -second category and so  $L$  is not a  $\mu$ -meager set which implies  $i_1(c_1(L)) \neq \emptyset$ . Take  $D = i_1(c_1(L))$ . Then  $D \in \tilde{\mu}_1$  so that  $D \cap c_2P \neq \emptyset$ . Thus,  $c_1L \cap c_2P \neq \emptyset$ . Choose  $t \in (c_1L \cap c_2P)$ . Then  $t \in c_1L$  which implies  $H \cap L \neq \emptyset$  for every  $H \in \mu_1(t)$ , by Lemma 2. By hypothesis,  $i_{\mu_1}(H \cap L) \neq \emptyset$ . This implies  $c_2P \cap i_{\mu_1}(H \cap L) \neq \emptyset$  which implies  $c_2P \cap (H \cap L) \neq \emptyset$  which turn implies that  $c_2P \cap L \neq \emptyset$ . Since  $L \in \tilde{\mu}_2$  we have  $P \cap L \neq \emptyset$ , by Lemma 3. Hence  $P$  is  $\mu_2$ -dense.

**Theorem 26.** Let  $(X, \mu_1, \mu_2)$  be a BGTS here  $\mu_1 = \mu$  and  $\mu_2 = \mu^*$  where  $\mu$  is a GT on  $X$ . If  $\mu_1$  has the  $\mathcal{I}$ -property, then every  $(1, 2)^*$ -dense set is  $\mu_2$ -dense in  $X$ .

*Proof.* Let  $Q \in (1, 2)^* - \mathcal{D}(X)$ . Then  $c_2Q \cap K \neq \emptyset$  for every  $K \in \tilde{\sigma}_1$ . Let  $L \in \tilde{\mu}_2$ . Then  $L = \bigcup_t (L_1^t \cap L_2^t \cap \dots \cap L_{n_t}^t)$  where each  $L_i^t \in \tilde{\mu}_1$  for  $i = 1$  to  $n_t$ . Choose  $D = L_1^k \cap L_2^k \cap \dots \cap L_{n_k}^k$  for some  $k$ ; each  $L_m^k \in \tilde{\mu}_1$  for  $m = 1$  to  $n_k$  with  $D \neq \emptyset$ . By hypothesis,  $i_{\mu_1}D \neq \emptyset$  which implies that  $i_{\mu_1}D \in \tilde{\mu}_1$  which turn implies that  $i_{\mu_1}D \cap c_2Q \neq \emptyset$ . Thus,  $c_2Q \cap D \neq \emptyset$  so that  $c_2Q \cap L \neq \emptyset$ . Since  $L \in \tilde{\mu}_2$  we have  $Q \cap L \neq \emptyset$ , By Lemma 3. Therefore,  $Q$  is  $\mu_2$ -dense.

**Theorem 27.** Let  $(X, \mu_1, \mu_2)$  be a BGTS here  $\mu_1 = \mu$  and  $\mu_2 = \mu^{**}$  where  $\mu$  is a generalized topology on  $X$ . If  $(X, \mu_1)$  is a hyperconnected space and if  $\mu_1$  is a sGT, then every non-null  $\mu_2$ -open set is  $(1, 2)^*$ -dense in  $X$ .

*Proof.* Let  $P \in \tilde{\mu}_2$ . Then  $P$  is of  $\mu_1$ -second category so that  $P$  is not a  $\mu_1$ -meager set which implies  $i_{\mu_1}(c_{\mu_1}(P)) \neq \emptyset$ . Thus,  $i_{\mu_1}(c_{\mu_1}(P)) \in \tilde{\mu}_1$ . Let  $K \in \tilde{\sigma}_1$ . By hypothesis,  $i_{\mu_1}K \in \tilde{\mu}_1$ . Since  $(X, \mu_1)$  is a hyperconnected space we have  $i_{\mu_1}K$  is  $\mu_1$ -dense. Therefore,  $i_{\mu_1}(c_{\mu_1}(P)) \cap i_{\mu_1}K \neq \emptyset$ . This implies  $c_{\mu_1}P \cap i_{\mu_1}K \neq \emptyset$  which implies that  $i_{\mu_1}K \cap P \neq \emptyset$ , by Lemma 3. Thus,  $P \cap K \neq \emptyset$ . Therefore,  $P \in (1, 2)^* - \mathcal{D}(X)$ .

**Theorem 28.** Let  $(X, \mu_1, \mu_2)$  be a BGTS here  $\mu_1 = \mu$  and  $\mu_2 = \mu^*$  where  $\mu$  is a sGT on  $X$ . If  $(X, \mu_1)$  is a hyperconnected space and if  $\mu_1$  has  $\mathcal{I}$ -property, then every non-null  $\mu_2$ -open set is a  $(1, 2)^*$ -dense set in  $X$ .

*Proof.* Let  $P \in \tilde{\mu}^*$ . Then  $P = \bigcup_t (P_1^t \cap P_2^t \cap \dots \cap P_{n_t}^t)$  where each  $P_i^t \in \tilde{\mu}_1$  for  $i = 1$  to  $n_t$ . Choose  $D = P_1^k \cap P_2^k \cap \dots \cap P_{n_k}^k$  for some  $k$ ; each  $P_m^k \in \tilde{\mu}_1$  for  $m = 1$  to  $n_k$  with  $D \neq \emptyset$ . By hypothesis,  $i_{\mu_1}D \neq \emptyset$  which implies that  $i_{\mu_1}D \in \tilde{\mu}_1$ . Since  $(X, \mu_1)$  is a hyperconnected space,  $i_{\mu_1}D$  is  $\mu_1$ -dense which implies  $P$  is  $\mu_1$ -dense. By hypothesis and Theorem 11,  $P$  is  $(1, 2)^*$ -dense.

**Theorem 29.** Let  $(X, \mu_1, \mu_2)$  be a bigeneralized topological space. If  $(X, \mu_s)$  is a hyperconnected space and if  $\mu_s$  is a sGT for  $s = 1, 2$ , then

- (a) Every non-null  $\mu_s$ -semi-open set is  $(s, v)^*$ -dense.
- (b) Every non-null  $\mu_s$ -pre-open set is  $(s, v)^*$ -dense.
- (c) Every non-null  $\mu_s$ - $\alpha$ -open set is  $(s, v)^*$ -dense.
- (d) Every non-null  $\mu_s$ - $\beta$ -open set is  $(s, v)^*$ -dense.

(e) Every non-null  $\mu_s$ - $b$ -open set is  $(s, v)^*$ -dense where  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Assume that,  $(X, \mu_s)$  is a hyperconnected space and  $\mu_s$  is a sGT for  $s = 1, 2$ . Choose  $s = 2$  and  $v = 1$ . Then  $(X, \mu_2)$  is a hyperconnected space,  $\mu_2$  is a strong generalized topology.

(a). Let  $Q$  be a non-null  $\mu_s$ -semi-open set. Then  $Q$  is  $\mu_2$ -semi-open set in  $X$ . Let  $H \in \tilde{\sigma}_2$ . Suppose  $H \in \tilde{\mu}_2$ . Then there is nothing to prove. Suppose that,  $H \notin \tilde{\mu}_2$ . Here  $H \subset c_2(i_2(H))$  which implies  $i_2(H) \in \tilde{\mu}_2$ , by our assumption. Since  $(X, \mu_2)$  is a hyperconnected space we have  $i_2H$  is a  $\mu_2$ -dense set in  $X$ . Also,  $Q \subset c_2(i_2(Q))$  which implies  $i_2(Q) \in \tilde{\mu}_2$  which turn implies that  $i_2(Q) \cap i_2H \neq \emptyset$ . Thus,  $Q \cap i_2H \neq \emptyset$ . Therefore,  $c_1Q \cap H \neq \emptyset$ . Hence  $Q \in (2, 1)^* - \mathcal{D}(X)$ .

(b). Let  $P$  be a non-null  $\mu_s$ -preopen set. Then  $P$  is  $\mu_2$ -preopen set in  $X$ . Let  $G \in \tilde{\sigma}_2$ . If  $G \in \tilde{\mu}_2$ , then the proof is trivial. Assume that,  $G \notin \tilde{\mu}_2$ . Here  $G \subset c_2(i_2(G))$  which implies  $i_2(G) \in \tilde{\mu}_2$ , by our assumption which turn implies that  $i_2G$  is a  $\mu_2$ -dense set in  $X$ . Also,  $P \subset i_2(c_2(P))$  so that  $i_2(c_2(P)) \in \tilde{\mu}_2$  for that  $i_2(c_2(P)) \cap i_2G \neq \emptyset$ . Thus,  $c_2P \cap i_2G \neq \emptyset$  so that  $P \cap i_2G \neq \emptyset$ , by Lemma 3. Therefore,  $c_1P \cap G \neq \emptyset$ . Hence  $P \in (2, 1)^* - \mathcal{D}(X)$ .

(c). Let  $K$  be a non-null  $\mu_s$ - $\alpha$ -open set. Then  $K$  is  $\mu_2$ - $\alpha$ -open set in  $X$  which implies  $K$  is  $\mu_2$ -semi-open set. Hence  $K \in (2, 1)^* - \mathcal{D}(X)$ , by (a).

(d). Choose  $L$  be a non-null  $\mu_s$ - $\beta$ -open set. Then  $L$  is  $\mu_2$ - $\beta$ -open set in  $X$ . Let  $M \in \tilde{\sigma}_2$ . If  $M \in \tilde{\mu}_2$ , then there is nothing to prove. Suppose  $M \notin \tilde{\mu}_2$ . Since  $M \subset c_2(i_2(M))$  we have  $i_2(M) \in \tilde{\mu}_2$ , by our assumption. By our assumption,  $i_2M$  is a  $\mu_2$ -dense set in  $X$ . Also,  $L \subset c_2(i_2(c_2(L)))$  for that  $i_2(c_2(L)) \in \tilde{\mu}_2$  which turn implies that  $i_2(c_2(L)) \cap i_2M \neq \emptyset$ . Thus,  $c_2L \cap i_2M \neq \emptyset$  so that  $L \cap i_2M \neq \emptyset$ , by Lemma 3. Therefore,  $c_1L \cap M \neq \emptyset$ . Hence  $L \in (2, 1)^* - \mathcal{D}(X)$ .

(e). Take  $F$  be a non-null  $\mu_s$ - $b$ -open set. We get  $F$  is  $\mu_2$ - $b$ -open set in  $X$ . Let  $V \in \tilde{\sigma}_2$ . If  $V \in \tilde{\mu}_2$ , then the proof is obvious. Assume that,  $V \notin \tilde{\mu}_2$  then  $V \subset c_2(i_2(V))$  so that  $i_2(V) \in \tilde{\mu}_2$ , by our assumption. Thus,  $i_2V$  is a  $\mu_2$ -dense set in  $X$ . Here,  $F \subset c_2(i_2(F)) \cup i_2(c_2(F))$  which implies

$$(1) \quad i_2(c_2(F)) \in \tilde{\mu}_2$$

or

$$(2) \quad i_2(F) \in \tilde{\mu}_2$$

or

$$(3) \quad i_2(c_2(F)) \in \tilde{\mu}_2 \quad \text{and} \quad i_2(F) \in \tilde{\mu}_2$$

From the above three cases, we get  $F \cap i_2V \neq \emptyset$ . Therefore,  $c_1F \cap V \neq \emptyset$ . Hence  $F \in (2, 1)^* - \mathcal{D}(X)$ .

By similar considerations, we can prove this theorem for the case  $s = 1$  and  $v = 2$ .

**Theorem 30.** *Let  $(X, \mu_1, \mu_2)$  be a BGTS. If  $(X, \mu_s)$  is a hyperconnected space and if  $\mu_s$  is a sGT for  $s = 1, 2$ , then*

- (a) Every non-null  $(s, v)$ - $\mu$ -pre-open set is  $(s, v)^*$ -dense.  
 (b) Every non-null  $(s, v)$ - $\mu$ - $\alpha$ -open set is  $(s, v)^*$ -dense where  $s, v = 1, 2$  ;  $s \neq v$ .

*Proof.* Assume that,  $(X, \mu_s)$  is a hyperconnected space and  $\mu_s$  is a strong generalized topological space for  $s = 1, 2$ . Take  $s = 2$  and  $v = 1$ . Then  $(X, \mu_2)$  is a hyperconnected space,  $\mu_2$  is a sGT.

(a). Let  $Q$  be a non-null  $(s, v)$ - $\mu$ -pre-open set where  $s, v = 1, 2$  ;  $s \neq v$ . Then  $Q$  is  $(2, 1)$ - $\mu$ -pre-open. Let  $K \in \tilde{\sigma}_2$ . If  $K \in \tilde{\mu}_2$ , then there is nothing to prove. Assume that,  $K \notin \tilde{\mu}_2$ . Here  $K \subset c_2(i_2(K))$ . By our assumption,  $i_2K$  is  $\mu_2$ -dense. Since  $Q \subset i_2(c_1(Q))$  we have  $i_2(c_1(Q)) \in \tilde{\mu}_2$ . This implies  $i_2(c_1(Q)) \cap i_2K \neq \emptyset$  which implies  $c_1(Q) \cap i_2K \neq \emptyset$  which turn implies that  $c_1Q \cap K \neq \emptyset$ . Hence  $Q \in (2, 1)^* - \mathcal{D}(X)$ .

(b). Take  $P$  be a non-null  $(s, v)$ - $\mu$ - $\alpha$ -open set where  $s, v = 1, 2$  ;  $s \neq v$ . We get  $P$  is  $(2, 1)$ - $\mu$ - $\alpha$ -open. Let  $G \in \tilde{\sigma}_2$ . If  $G \in \tilde{\mu}_2$ , then the proof is trivial. Suppose  $G \notin \tilde{\mu}_2$ . By our assumption,  $i_2G$  is  $\mu_2$ -dense. Since  $P \subset i_2(c_1(i_2(P)))$  we have  $i_2(c_1(i_2(P))) \in \tilde{\mu}_2$ . This implies  $i_2(c_1(i_2(P))) \cap i_2G \neq \emptyset$  which implies  $c_1(i_2(P)) \cap i_2G \neq \emptyset$  which turn implies that  $c_1P \cap i_2G \neq \emptyset$ . Thus,  $c_1P \cap G \neq \emptyset$ . Hence  $P \in (2, 1)^* - \mathcal{D}(X)$ .

Similarly we can prove this theorem for the case  $s = 1$  and  $v = 2$ .

**Theorem 31.** *Let  $(X, \mu_1, \mu_2)$  be a BGTS. If  $(X, \mu_s)$  is a hyperconnected space,  $\mu_s \subset \mu_v$  and if  $\mu_s$  is a strong generalized topology, then every non-null  $(s, v)$ - $\mu$ -semi-open set is  $(s, v)^*$ -dense where  $s, v = 1, 2$  ;  $s \neq v$ .*

*Proof.* Assume that,  $(X, \mu_s)$  is a hyperconnected space;  $\mu_s \subset \mu_v$  and  $\mu_s$  is a strong generalized topological space for  $s = 1, 2$ .

Take  $s = 1$  and  $v = 2$ . Then  $(X, \mu_1)$  is a hyperconnected space;  $\mu_1 \subset \mu_2$  and  $\mu_1$  is a sGT.

Let  $Q$  be a non-null  $(s, v)$ - $\mu$ -semi-open set where  $s, v = 1, 2$  ;  $s \neq v$ . Then  $Q$  is  $(1, 2)$ - $\mu$ -semi-open. Let  $H \in \tilde{\sigma}_1$ . Suppose  $H \in \tilde{\mu}_1$ , then there is nothing to prove. Assume that,  $H \notin \tilde{\mu}_1$ . Here  $H \subset c_1(i_1(H))$ . By our assumption,  $i_1H$  is  $\mu_1$ -dense. Since  $Q \subset c_2(i_1(Q))$  we have  $i_1(Q) \in \tilde{\mu}_1$ ,  $\mu_1 \subset \mu_2$  and  $\mu_1$  is a sGT. This implies  $i_1(Q) \cap i_1H \neq \emptyset$  which implies  $c_2Q \cap H \neq \emptyset$ . Hence  $Q \in (1, 2)^* - \mathcal{D}(X)$ .

Choose  $s = 2$  and  $v = 1$ . We get  $(X, \mu_2)$  is a hyperconnected space;  $\mu_2 \subset \mu_1$  and  $\mu_2$  is a sGT.

Consider  $P$  is a non-null  $(s, v)$ - $\mu$ -semi-open set where  $s, v = 1, 2$  ;  $s \neq v$ . Then  $P$  is  $(2, 1)$ - $\mu$ -semi-open. Let  $G \in \tilde{\sigma}_2$ . If  $G \in \tilde{\mu}_2$ , then the proof is obvious. Suppose  $G \notin \tilde{\mu}_2$ .

Here  $G \subset c_2(i_2(G))$ . By hypothesis,  $i_2G$  is  $\mu_2$ -dense. Since  $P \subset c_1(i_2(P))$  we have  $i_2(P) \in \tilde{\mu}_2$ , by hypothesis so that  $i_2(P) \cap i_2G \neq \emptyset$  which implies that  $c_1P \cap G \neq \emptyset$ . Hence  $P \in (2, 1)^* - \mathcal{D}(X)$ .

In the rest of this section, we analyze the nature of  $(s, v)^*$ -dense sets in a subspace.

Let  $(X, \mu)$  be a GTS,  $Q \subset X$  and  $\mu_Q = \{P \cap Q \mid P \in \mu\}$ . Then  $\mu_Q$  is called relative generalized topology on  $Q$  [7].

**Theorem 32.** Let  $(X, \mu_1, \mu_2)$  be a bigeneralized topological space,  $Q$  be a  $\mu_s$ -dense subspace of  $X$  for  $s = 1, 2$ . If  $P$  is a  $\mu_{s_Q}$ -dense and  $\mu_s$  is a sGT, then  $P \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Assume that,  $Q$  is  $\mu_s$ -dense in  $X$  and  $\mu_s$  is a strong generalized topology for  $s = 1, 2$ . Let  $P$  be a  $\mu_{s_Q}$ -dense set in  $Q$  where  $s = 1, 2$ .

Take  $s = 1$  and  $v = 2$ . Then  $Q$  is  $\mu_1$ -dense,  $\mu_1$  is a sGT and  $P$  is  $\mu_{1_Q}$ -dense in  $Q$ . Let  $K \in \tilde{\sigma}_1$ . If  $K \in \tilde{\mu}_1$ , then further proof investigation no longer required. Suppose  $K \notin \tilde{\mu}_1$ . By hypothesis,  $i_{\mu_1}K \in \tilde{\mu}_1$  which implies  $i_{\mu_1}K \cap Q \in \mu_{1_Q}$ . Take  $L = i_{\mu_1}K \cap Q$ . Then  $L \cap P \neq \emptyset$  so that  $i_{\mu_1}K \cap P \neq \emptyset$ . This implies  $K \cap P \neq \emptyset$  which implies  $K \cap c_2P \neq \emptyset$ . Therefore,  $P \in (1, 2)^* - \mathcal{D}(X)$ .

Fix  $s = 2, v = 1$ . Then  $Q$  is  $\mu_2$ -dense,  $\mu_2$  is a sGT and  $P$  is  $\mu_{2_Q}$ -dense in  $Q$ . Let  $M \in \tilde{\sigma}_2$ . If  $M \in \tilde{\mu}_2$ , then the proof is directly follows. Assume that,  $M \notin \tilde{\mu}_2$ . By hypothesis,  $i_{\mu_2}M \in \tilde{\mu}_2$  which implies  $i_{\mu_2}M \cap Q \in \mu_{2_Q}$ . Take  $V = i_{\mu_2}M \cap Q$ . Then  $V \cap P \neq \emptyset$  so that  $i_{\mu_2}M \cap P \neq \emptyset$  which implies  $M \cap P \neq \emptyset$  which turn implies that  $M \cap c_2P \neq \emptyset$ . Hence,  $P \in (2, 1)^* - \mathcal{D}(X)$ .

**Theorem 33.** Let  $(X, \mu_1, \mu_2)$  be a BGTS,  $\mu_s$  satisfy the  $\mathcal{I}$ -property and  $Q$  be a  $\mu_s$ -open subset of  $X$  for  $s = 1, 2$ . If  $\mu_s \subset \mu_v$  and if  $P \in (s, v)^* - \mathcal{D}(X)$ , then  $P$  is  $\mu_{s_Q}$ -dense set in  $Q$  where  $P \subset Q$ ;  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Assume that,  $Q$  is  $\mu_s$ -open subset of  $X$ ;  $\mu_s \subset \mu_v$  and  $P \in (s, v)^* - \mathcal{D}(X)$  for  $s, v = 1, 2$ ;  $s \neq v$ .

Choose  $s = 1$  and  $v = 2$ . Then  $Q \in \tilde{\mu}_1$ ;  $\mu_1 \subset \mu_2$  and  $P \in (1, 2)^* - \mathcal{D}(X)$ . Let  $L \in \mu_{1_Q}$ . Then  $L = K \cap Q$  where  $K \in \tilde{\mu}_1$ . By hypothesis,  $i_{\mu_1}L \in \tilde{\mu}_1$ . This implies  $L \cap c_2P \neq \emptyset$  which implies that  $L \cap P \neq \emptyset$ , by Lemma 3. Hence  $P$  is a  $\mu_{1_Q}$ -dense set in  $Q$ .

Fix  $s = 2$  and  $v = 1$ . We get  $Q \in \tilde{\mu}_2$ ;  $\mu_2 \subset \mu_1$  and  $P \in (2, 1)^* - \mathcal{D}(X)$ . Let  $V \in \mu_{2_Q}$ . Then  $V = M \cap Q$  where  $M \in \tilde{\mu}_2$ . By assumption,  $i_{\mu_2}V \in \tilde{\mu}_2$  so that  $V \cap c_1P \neq \emptyset$  which implies that  $V \cap P \neq \emptyset$ , by Lemma 3. Therefore,  $P$  is a  $\mu_{2_Q}$ -dense set in  $Q$ .

**Theorem 34.** Let  $(X, \mu_1, \mu_2)$  be a bigeneralized topological space,  $Q$  be a  $\mu_s$ -open subset of  $X$  and  $\mu_s$  satisfy the  $\mathcal{I}$ -property for  $s = 1, 2$ . If  $\mu_{s_Q}$  is a sGT and  $P \in (s, v)^* - \mathcal{D}(X)$ , then  $P \in (\mu_{s_Q}, \mu_v) - \mathcal{D}(Q)$  where  $P \subset Q$ ;  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Suppose that,  $Q \in \tilde{\mu}_s$ ,  $\mu_s$  satisfy the  $\mathcal{I}$ -property and  $\mu_{s_Q}$  is a strong generalized topology for  $s = 1, 2$ . Let  $P \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2$ ;  $s \neq v$ .

Choose  $s = 1$  and  $v = 2$ . Then  $Q \in \tilde{\mu}_1$ ,  $\mu_1$  satisfy the  $\mathcal{I}$ -property,  $\mu_{1_Q}$  is a sGT and  $P \in (1, 2)^* - \mathcal{D}(X)$ . Let  $J \in \tilde{\sigma}_{1_Q}$ . If  $J \in \tilde{\mu}_{1_Q}$ , then there is nothing to prove. Suppose  $J \notin \tilde{\mu}_{1_Q}$ . Since  $J \in \tilde{\sigma}_{1_Q}$  and  $\mu_{1_Q}$  is a strong subspace generalized topology we have  $i_{1_Q}J \in \tilde{\mu}_{1_Q}$ . Take  $K = i_{1_Q}J$ . Then  $K \neq \emptyset$  and  $K = L \cap Q$  where  $L \in \tilde{\mu}_1$ . Since  $L, Q \in \tilde{\mu}_1$  and  $\mu_1$  satisfy the  $\mathcal{I}$ -property,  $i_{\mu_1}(K) \in \tilde{\mu}_1$ . This implies  $i_{\mu_1}K \cap c_2P \neq \emptyset$  which implies  $K \cap c_2P \neq \emptyset$  which turn implies that  $J \cap c_2P \neq \emptyset$ . Hence  $P \in (\mu_{1_Q}, \mu_2)^* - \mathcal{D}(Q)$ .

Take  $s = 2$  and  $v = 1$ . We get  $Q \in \tilde{\mu}_2$ ,  $\mu_2$  satisfy the  $\mathcal{I}$ -property,  $\mu_{2_Q}$  is a sGT and  $P \in (2, 1)^* - \mathcal{D}(X)$ . Let  $V \in \tilde{\sigma}_{2_Q}$ . If  $V \in \tilde{\mu}_{2_Q}$ , then the proof is obvious. Assume  $V \notin \tilde{\mu}_{2_Q}$ . by the definition of  $V$  and  $\mu_{2_Q}$  is a strong subspace generalized topology we have  $i_{2_Q}V \in \tilde{\mu}_{2_Q}$ . Take  $L = i_{2_Q}V$ . Then  $L \neq \emptyset$  and  $L = M \cap Q$  where  $M \in \tilde{\mu}_2$ . Here,  $M, Q \in \tilde{\mu}_2$  and  $\mu_2$  satisfy the  $\mathcal{I}$ -property,  $i_{\mu_2}(L) \in \tilde{\mu}_2$  so that  $i_{\mu_2}L \cap c_1P \neq \emptyset$  which implies  $L \cap c_1P \neq \emptyset$  which turn implies that  $V \cap c_1P \neq \emptyset$ . Therefore,  $P \in (\mu_{2_Q}, \mu_1)^* - \mathcal{D}(Q)$ .

**Theorem 35.** Let  $(X, \mu_1, \mu_2)$  be a BGTS and  $Q$  be a  $\mu_s$ -dense subset of  $X$  for  $s = 1, 2$ . If  $\mu_s$  is a strong generalized topology and if  $P \in (\mu_{s_Q}, \mu_{v_Q})^* - \mathcal{D}(Q)$ , then  $P \in (s, v)^* - \mathcal{D}(X)$  for  $s, v = 1, 2$ ;  $s \neq v$ .

*Proof.* Assume that,  $P \in (\mu_{s_Q}, \mu_{v_Q})^* - \mathcal{D}(Q)$  where  $s, v = 1, 2$ ;  $s \neq v$ .

Choose  $s = 1$  and  $v = 2$ . Then  $P \in (\mu_{1_Q}, \mu_{2_Q})^* - \mathcal{D}(Q)$ . Let  $H \in \tilde{\sigma}_1$ . Suppose  $H \in \tilde{\mu}_1$ . Then  $H \cap Q \in \tilde{\mu}_{1_Q}$ . Take  $K = H \cap Q$ . Then  $K \cap c_{2_Q}P \neq \emptyset$  so that  $K \cap c_2P \neq \emptyset$ . This implies  $H \cap c_2(P) \neq \emptyset$  which implies that  $P \in (1, 2)^* - \mathcal{D}(X)$ . If  $H \notin \tilde{\mu}_1$ , then  $i_1H \in \tilde{\mu}_1$ . Take  $L = i_1H$ . Then by similar arguments in the above case, we get  $P \in (1, 2)^* - \mathcal{D}(X)$ .

Fix  $s = 2$  and  $v = 1$ . We get  $P \in (\mu_{2_Q}, \mu_{1_Q})^* - \mathcal{D}(Q)$ . Let  $G \in \tilde{\sigma}_2$ . Suppose  $G \in \tilde{\mu}_2$  we get  $G \cap Q \in \tilde{\mu}_{2_Q}$ . Choose  $K = G \cap Q$  so that  $K \cap c_{1_Q}P \neq \emptyset$  which implies that  $K \cap c_1P \neq \emptyset$ . Thus,  $G \cap c_1(P) \neq \emptyset$  so that  $P \in (2, 1)^* - \mathcal{D}(X)$ . Assume that,  $G \notin \tilde{\mu}_2$ , then  $i_2G \in \tilde{\mu}_2$ . Take  $L = i_2G$ . By similar considerations, we get  $P \in (2, 1)^* - \mathcal{D}(X)$ .

#### 4. Images of $(s, v)^*$ -dense sets

A function  $f : (X, \mu) \rightarrow (Y, \eta)$  is said to be  $(\mu, \eta)$ -continuous [4] (resp.  $(\mu, \eta)$ -open) [18] if  $f^{-1}(Q) \in \mu$  whenever  $Q \in \eta$  (resp.  $f(P) \in \eta$  whenever  $P \in \mu$ ).

**Lemma 5.** [12, Lemma 7.3] A map  $f : (X, \mu) \rightarrow (Y, \eta)$  is  $(\mu, \eta)$ -open if and only if  $f^{-1}(cP) \subset c(f^{-1}(P))$  for any  $P \subset Y$ .

**Theorem 36.** Let  $(X, \mu_1, \mu_2)$  and  $(Y, \eta_1, \eta_2)$  be two BGTSs. If  $f : X \rightarrow Y$  is  $(\mu_t, \eta_t)$ -continuous for  $t = 1, 2$  and  $\eta_s$  is sGT for  $s = 1, 2$ , then image of a  $(s, v)^*$ -dense set is  $(s, v)^*$ -dense where  $s, v = 1, 2$  ;  $s \neq v$ .

*Proof.* Assume that,  $f$  is  $(\mu_t, \eta_t)$ -continuous for  $t = 1, 2$ . Let  $Q \in (s, v)^* - \mathcal{D}(X)$  where  $s, v = 1, 2$  ;  $s \neq v$ .

Fix  $s = 1$  and  $v = 2$ . We get  $Q \in (1, 2)^* - \mathcal{D}(X)$  so that  $c_{\mu_2}Q \cap H \neq \emptyset$  for  $H \in \tilde{\sigma}_{\mu_1}$ . Let  $K \in \tilde{\sigma}_{\eta_1}$ . By assumption,  $\eta_1$  is a sGT so that  $i_{\eta_1}K \in \tilde{\eta}_1$ . This implies  $f^{-1}(i_{\eta_1}K) \in \tilde{\mu}_1$ , by hypothesis which implies that  $c_{\mu_2}Q \cap f^{-1}(i_{\eta_1}K) \neq \emptyset$ . Thus,  $f(c_{\mu_2}Q \cap f^{-1}(i_{\eta_1}K)) \neq \emptyset$  so that  $f(c_{\mu_2}Q) \cap i_{\eta_1}K \neq \emptyset$ . Since  $f$  is  $(\mu_1, \eta_1)$ -continuous we have  $c_{\eta_2}(f(Q)) \cap i_{\eta_1}K \neq \emptyset$ . Therefore,  $f(Q) \in (1, 2)^* - \mathcal{D}(Y)$ .

Take  $s = 2$  and  $v = 1$ . Then  $Q \in (2, 1)^* - \mathcal{D}(X)$  and so  $c_{\mu_1}Q \cap M \neq \emptyset$  for  $M \in \tilde{\sigma}_{\mu_2}$ . Choose  $L \in \tilde{\sigma}_{\eta_2}$ . By hypothesis,  $\eta_2$  is a sGT so that  $i_{\eta_2}L \in \tilde{\eta}_2$  which implies  $f^{-1}(i_{\eta_2}L) \in \tilde{\mu}_2$ , by assumption which turn implies that  $c_{\mu_1}Q \cap f^{-1}(i_{\eta_2}L) \neq \emptyset$ . Thus,  $f(c_{\mu_1}Q \cap f^{-1}(i_{\eta_2}L)) \neq \emptyset$  for that  $f(c_{\mu_1}Q) \cap i_{\eta_2}L \neq \emptyset$ . By hypothesis,  $c_{\eta_1}(f(Q)) \cap i_{\eta_2}L \neq \emptyset$ . Hence  $f(Q) \in (2, 1)^* - \mathcal{D}(Y)$ .

**Theorem 37.** Let  $(X, \mu_1, \mu_2)$  and  $(Y, \eta_1, \eta_2)$  be two bigeneralized topological spaces. If  $f : X \rightarrow Y$  is  $(\mu_t, \eta_t)$ -open for  $t = 1, 2$  ; one-one map and  $\mu_s$  is sGT for  $s = 1, 2$ , then inverse image of a  $(s, v)^*$ -dense set is  $(s, v)^*$ -dense.

*Proof.* Let  $P \in (s, v)^* - \mathcal{D}(Y)$  for  $s, v = 1, 2$  ;  $s \neq v$ .

Fix  $s = 1$  and  $v = 2$ . Then  $P \in (1, 2)^* - \mathcal{D}(Y)$  so that  $c_{\eta_2}P \cap L \neq \emptyset$  for all  $L \in \tilde{\sigma}_{\eta_1}$ . Let  $D \in \tilde{\sigma}_{\mu_1}$  so that  $i_{\mu_1}D \in \tilde{\mu}_1$ , by assumption. Since  $f$  is  $(\mu_1, \eta_1)$ -open we have  $f(i_{\mu_1}D) \in \tilde{\eta}_1$ . This implies  $c_{\eta_2}P \cap f(i_{\mu_1}D) \neq \emptyset$  which implies that  $f^{-1}(c_{\eta_2}P) \cap f^{-1}(f(i_{\mu_1}D)) \neq \emptyset$ . Here  $f$  is an injective map,  $f^{-1}(c_{\eta_2}P) \cap i_{\mu_1}D \neq \emptyset$ . By Lemma 5,  $c_{\mu_2}(f^{-1}(P)) \cap i_{\mu_1}D \neq \emptyset$ . Hence  $f^{-1}(P) \in (1, 2)^* - \mathcal{D}(X)$ .

Choose  $s = 2$  and  $v = 1$ . We get  $P \in (2, 1)^* - \mathcal{D}(Y)$  implies that  $c_{\eta_1}P \cap M \neq \emptyset$  for all  $M \in \tilde{\sigma}_{\eta_2}$ . Choose  $V \in \tilde{\sigma}_{\mu_2}$  so that  $i_{\mu_2}V \in \tilde{\mu}_2$ , by hypothesis which implies  $f(i_{\mu_2}V) \in \tilde{\eta}_2$ . Thus,  $c_{\eta_1}P \cap f(i_{\mu_2}V) \neq \emptyset$  so that  $f^{-1}(c_{\eta_1}P) \cap f^{-1}(f(i_{\mu_2}V)) \neq \emptyset$ . Since  $f$  is an injective map,  $f^{-1}(c_{\eta_1}P) \cap i_{\mu_2}V \neq \emptyset$ . By Lemma 5,  $c_{\mu_1}(f^{-1}(P)) \cap i_{\mu_2}V \neq \emptyset$ . Therefore,  $f^{-1}(P) \in (2, 1)^* - \mathcal{D}(X)$ .

## 5. Applications for $(s, v)^*$ -dense sets

In 1999, Molodstov introduced a new mathematical tool namely, soft set theory [14]. It has been used for dealing with uncertainty. Most of the researchers presented an appli-

cation of soft sets in decision-making problems.

Motivated, by this we try to give an example of the soft set using  $(s, v)^*$ -dense and some subsets defined in a bigeneralized topological space and also in generalized topological space.

**Example 38.** Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{a, b, c, d\}$ ;

$$\mu_1 = \{\emptyset, \{b\}, \{a, d\}, \{b, d\}, \{a, b, d\}\};$$

and

$$\mu_2 = \{\emptyset, \{c\}, \{a, b\}, \{a, c\}, \{a, b, c\}\}.$$

Here,

- $\sigma_1 = \{\emptyset, \{b\}, \{c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ .
- $\sigma_2 = \{\emptyset, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, X\}$ .

Then we get,

- $(1, 2)^* - \mathcal{D}(X) = \{\{a, c\}, \{b, c\}, \{a, b, c\}, \{a, c, d\}, \{b, c, d\}, X\}$ .
- $(2, 1)^* - \mathcal{D}(X) = \{\{d\}, \{a, b\}, \{a, d\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ .

Let  $U = \{a, c, d\}$  be a subset of  $X$  and  $E = \{(1, 2)^*$ -dense set,  $(2, 1)^*$ -dense set,  $(1, 2)^*$ -dense but not  $(2, 1)^*$ -dense,  $(2, 1)^*$ -dense but not  $(1, 2)^*$ -dense,  $(1, 2)^*$ -dense and  $(2, 1)^*$ -dense  $\} = \{e_1, e_2, e_3, e_4, e_5\}$  is the set of parameters. Define a map  $F$  from  $E$  to  $\exp(U)$  by,  $F(e_1) = \{a, c\}$ ;  $F(e_2) = \{d\}$ ;  $F(e_3) = \{a, c\}$ ;  $F(e_4) = \{c, d\}$ ;  $F(e_5) = \{a, c, d\}$ . Then the pair  $(F, E)$  is a soft set over  $U$ .

**Example 39.** Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{p\}, \{p, s\}, \{q, s\}, \{p, q, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{q\}, \{p, r\}, \{q, r\}, \{p, q, r\}\}.$$

Here,

- $\mu_1$ -semi-open sets =  $\{\emptyset, \{p\}, \{r\}, \{p, r\}, \{p, s\}, \{q, s\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}$ .
- $\mu_1$ -pre-open sets =  $\{\emptyset, \{p\}, \{s\}, \{p, q\}, \{p, s\}, \{q, s\}, \{p, q, s\}\}$ .
- $\mu_1 - \alpha$ -open sets =  $\{\emptyset, \{p\}, \{p, s\}, \{q, s\}, \{p, q, s\}\}$ .
- $\mu_1 - \beta$ -open sets =  $\exp(X) - \{\{q\}, \{q, r\}\}$ .
- $\mu_1 - b$ -open sets =  $\exp(X) - \{q\}$ .

Let  $U = \{q, r, s\}$  be a subset of  $X$  and  $E = \{\mu_1$ -semi-open set,  $\mu_1$ -pre-open set,  $\mu_1 - \alpha$ -open set,  $\mu_1 - \beta$ -open set,  $\mu_1 - b$ -open set  $\} = \{e_1, e_2, e_3, e_4, e_5\}$  is the set of parameters. Define a function  $F$  from a set  $E$  to  $\exp(U)$  by,  $F(e_1) = \{r\}$ ;  $F(e_2) = \{s\}$ ;  $F(e_3) = \{q, s\}$ ;  $F(e_4) =$

$\{r, s\}; F(e_5) = \{q, r\}$ . Then the pair  $(F, E)$  is a soft set over  $U$ .

Here,

- $\mu_2$ -semi-open sets =  $\{\emptyset, \{q\}, \{s\}, \{p, r\}, \{q, r\}, \{q, s\}, \{p, q, r\}, \{p, r, s\}, \{q, r, s\}, X\}$ .
- $\mu_2$ -pre-open sets =  $\{\emptyset, \{q\}, \{r\}, \{p, q\}, \{p, r\}, \{q, r\}, \{p, q, r\}\}$ .
- $\mu_2 - \alpha$ -open sets =  $\{\emptyset, \{q\}, \{p, r\}, \{q, r\}, \{p, q, r\}\}$ .
- $\mu_2 - \beta$ -open sets =  $exp(X) - \{\{p\}, \{p, s\}\}$ .
- $\mu_2 - b$ -open sets =  $exp(X) - \{\{p\}, \{p, s\}\}$ .

Let  $U = \{p, r, s\}$  be a subset of  $X$  and  $E = \{\mu_2$ -semi-open set,  $\mu_2$ -pre-open set,  $\mu_2 - \alpha$ -open set,  $\mu_2 - \beta$ -open set,  $\mu_2 - b$ -open set  $\} = \{e_1, e_2, e_3, e_4, e_5\}$  is the set of parameters. Define a function  $F$  from a set  $E$  to  $exp(U)$  by,  $F(e_1) = \{s\}; F(e_2) = \{r\}; F(e_3) = \{q\}; F(e_4) = \{r, s\}; F(e_5) = \{p, r\}$ . Then the pair  $(F, E)$  is a soft set over  $U$ .

**Example 40.** Consider the BGTS  $(X, \mu_1, \mu_2)$  where  $X = \{p, q, r, s\}$ ;

$$\mu_1 = \{\emptyset, \{r\}, \{p, s\}, \{r, s\}, \{p, r, s\}\}$$

and

$$\mu_2 = \{\emptyset, \{q\}, \{q, s\}, \{r, s\}, \{q, r, s\}\}.$$

Here,

- $(s, v)$ - $\mu_1$ -regular open sets =  $\{\emptyset, \{r\}, \{p, r, s\}\}$ .
- $(s, v)$ - $\mu_1$ -semi-open sets =  $\{\emptyset, \{p\}, \{r\}, \{p, r\}, \{p, s\}, \{r, s\}, \{p, r, s\}\}$ .
- $(s, v)$ - $\mu_1$ -pre-open sets =  $\{\emptyset, \{r\}, \{s\}, \{p, s\}, \{r, s\}, \{p, r, s\}, \}$ .
- $(s, v)$ - $\mu_1$ - $\alpha$ -open sets =  $\{\emptyset, \{r\}, \{p, s\}, \{r, s\}, \{p, r, s\}\}$ .

Let  $U = \{p, r, s\}$  be a subset of  $X$  and  $E = \{(s, v)$ - $\mu_1$ -regular open,  $(s, v)$ - $\mu_1$ -semi-open set,  $(s, v)$ - $\mu_1$ -pre-open set,  $(s, v)$ - $\mu_1 - \alpha$ -open set  $\} = \{e_1, e_2, e_3, e_4, \}$  is the set of parameters. Define a map  $F$  from a non-null set  $E$  to  $exp(U)$  by,  $F(e_1) = \{r\}; F(e_2) = \{p\}; F(e_3) = \{s\}; F(e_4) = \{r, s\}$ . Then the pair  $(F, E)$  is a soft set over  $U$ .

Now,

- $(s, v)$ - $\mu_2$ -regular open sets =  $\{\{q\}, \{q, s\}, \{q, r, s\}\}$ .
- $(s, v)$ - $\mu_2$ -semi-open sets =  $\{\emptyset, \{q\}, \{q, s\}, \{r, s\}, \{p, q, s\}, \{p, r, s\}, \{q, r, s\}, X\}$ .
- $(s, v)$ - $\mu_2$ -pre-open sets =  $\{\emptyset, \{q\}, \{s\}, \{q, s\}, \{r, s\}, \{q, r, s\}, \}$ .
- $(s, v)$ - $\mu_2$ - $\alpha$ -open sets =  $\{\emptyset, \{q\}, \{q, s\}, \{r, s\}, \{q, r, s\}\}$ .

Let  $U = \{q, r, s\}$  be a subset of  $X$  and  $E = \{(s, v)$ - $\mu_2$ -regular open,  $(s, v)$ - $\mu_2$ -semi-open set,  $(s, v)$ - $\mu_2$ -pre-open set,  $(s, v)$ - $\mu_2 - \alpha$ -open set  $\} = \{e_1, e_2, e_3, e_4, \}$  is the set of parameters. Define a map  $F$  from a set  $E$  to  $exp(U)$  by,  $F(e_1) = \{q\}; F(e_2) = \{q, s\}; F(e_3) = \{s\}; F(e_4) = \{r, s\}$ . Then the pair  $(F, E)$  is a soft set over  $U$ .

## 6. Conclusion

In this article, we are given additional tricks for finding the significance of a given set in a bigeneralized topological space. Also, we have proven some results for checking whether the given set is  $(s, v)^*$ -dense or not. Finally, we defined soft sets using various open sets and  $(s, v)^*$ -dense sets.
